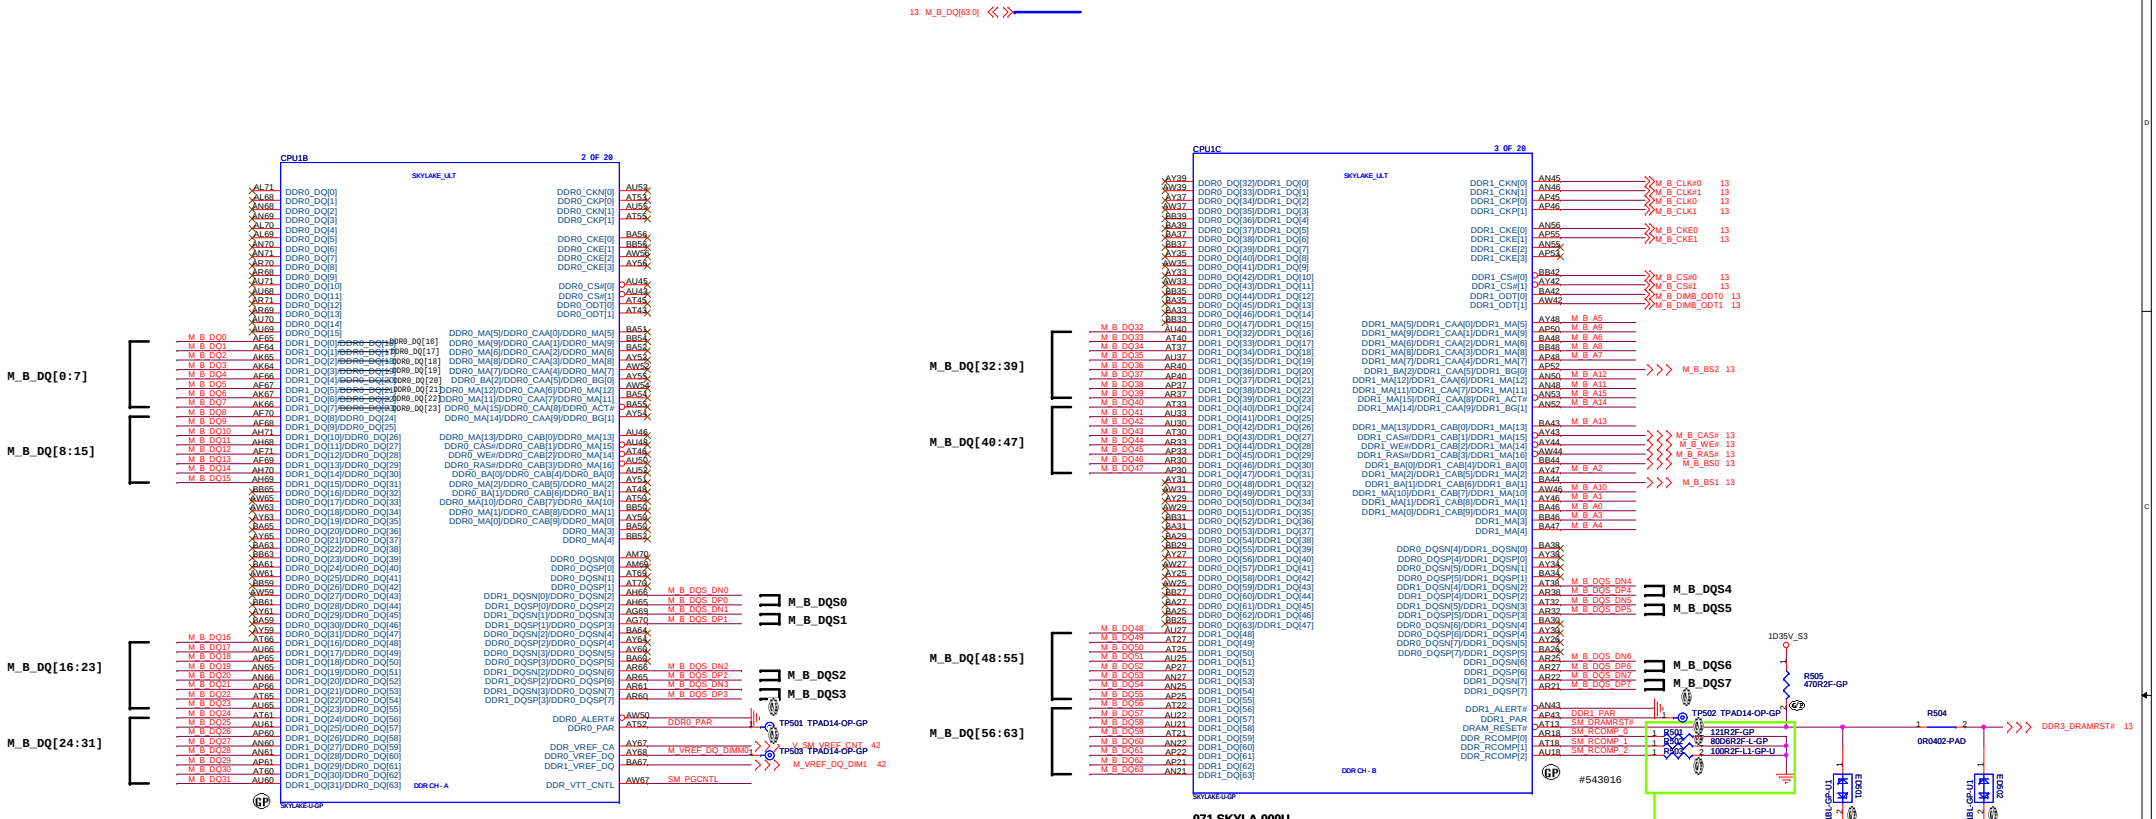
DDR3L ball type: Interleaved Type



DQ Bit Swapping is allowed within the same byte, and Byte Swapping is allowed within the same channel.
Clock (CLK and CLK#) and Strobe (DQS and DQS#) differential signal swapping within a pair is not allowed. Also differential clock pair to clock pair swapping within a channel is not allowed.

		DIMMs	ODT[1:0]		

Notes:
1. For additional ODT signal connection details reference the Customer Reference Board (CRB) schematics and board files (RVP3 - SKL-Y LPDDR3, RVP5 - SKL-U LPDDR3).
2. LPDDR3 Rank1 ODT is always disabled by BIOS/MRC. ODT signal is controlling only Rank0 ODT.
3. DDR3L ODT input is held high (Active). RTT NOM is defined by BIOS as High-Z in both ranks, when a Rank receives write command it enables RTT WR (set by BIOS after power training). Otherwise ODT gets RTT NOM (High-Z).
4. These guidelines are related to DDR3L supported Memory down topologies only. 2R x16 DDP single side, 2R x16 SOP dual sided and 2Rx8 dual side.

SC Digital_G-sensor

The Slave ADdress (SAD) associated to the LIS3DH is 001100xb. SDO/SA0 pad can be used to modify less significant bit of the device address. If SA0 pad is connected to voltage supply, LSb is ‘1’ (address 0011001b) else if SA0 pad is connected to ground, LSb value is ‘0’ (address 0011000b). This solution permits to connect and address two different accelerometers to the same I2C lines.

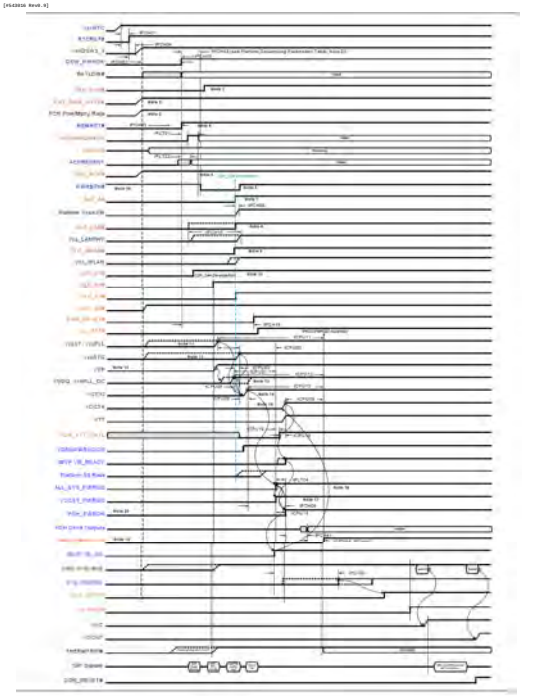
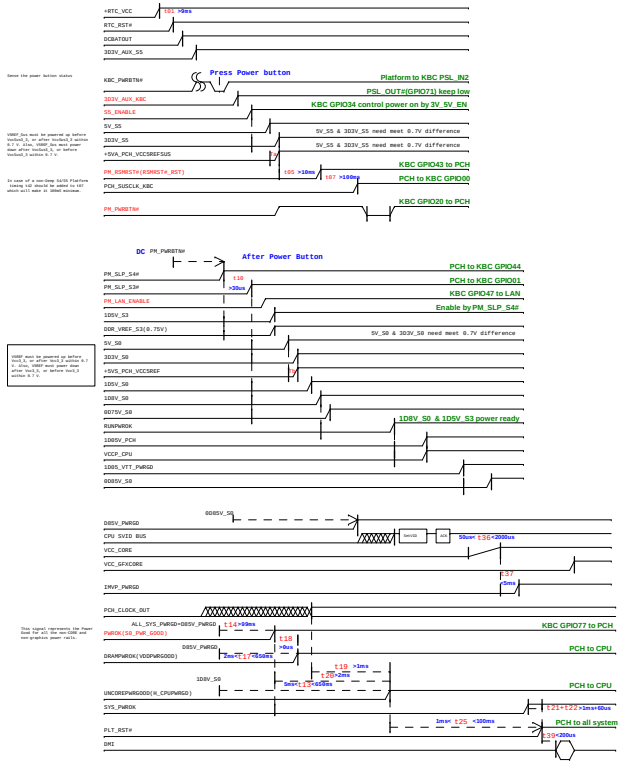
SKL-U/Y Timing Diagram for G3 to S0/M0 [Non Deep Sx Platform]

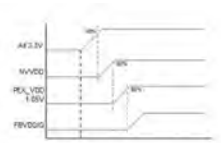


(DC mode)

Red Words: Controlled by EC GPIO



[dGPU] N16x Power-Up/Down Sequence



Notes: - All 3.3V includes all rails powered at 3.3V
- PEX_VDD 1.05V includes all rails that are shared

Note:
- The ramp time for any rail must be more than 40 us and is recommended to be less than 2ms.
- The ramp up overshoot should not exceed the silicon reliability limit voltage.
- The previous power rail must ramp up to 90% before the next power rail can start ramping up.
- No signal should be applied to the GPU before the power rails are fully ramped
- Refer to the JEDEC Memory Specification for memory related power sequencing.
- The order of NVVDD and PEX_VDD ramp-up can be reversed during GC6 exit when there is a back-to-back GC6 entry/exit and/or when PEX_VDD takes longer to ramp down during GC6 entry.

3.10.2.2 Power-Down Sequence

There is no specific power down sequence. However, residual voltage from power down must not violate the power-up sequence when back to back GPU power-down and power-up events take place.
